

STATEMENT OF PURPOSE

Young minds are usually curious about everything and so was mine, but as I grew up into a teenager, the prospect of how the mechanisms of machines and mobile phones work fascinated me a lot. I chose the science field to explore the subject more, but once I started understanding things, it was as like an addiction to learn more. Therefore, I took up the Electronic Science to satisfy my hunger for knowledge. Yet, I feel I have much to explore and learn.

Studying Electronic science was pretty interesting for me. I had a very particular interest in the PCB designing and its working by the coding. Through the interest in this field I've secured 2nd place in Basic Robotics training using Arduino. In this learning duration I also understood about the Artificial intelligence importance in my field. So, I started to grab the basic knowledge of coding with Python, MATLAB and VHDL programming language during my program of studying.

Artificial Intelligence is one such field that drives my attention towards it. I see my career in this particular field as my interests revolve around this. I would also like to contribute to the society and share my knowledge with as many as possible.

I would love to work in Automobile industry with knowledge of AI to make the automobiles safer for driving and monitor over them. To achieve this dream of mine I would love to study in the Imperial College London. I find it ideal university to realize my dream.
